                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò
                                             epidermal growth factor receptor precursor - chicken
N-Contains: protein-tyrosine kinase (EC 2.7.1.112) erbB
C.Species: Gallus gallus (chicken)
C.Species: Callus (chicken)
C.Species: Callus (chicken)
M. 1970-1978, 1988

PTM: LIGAND-BINDING INCREASES PHOSPHORYLATION ON TYROSINE RESIDUES (BY SIMILARITY).

POLYMORPHISM: THERE FOURS ALLELES DUE TO THE VARIATIONS IN POSITIONS 654 AND 655. ALLELE B1 (654-ILE-ILE-655) HAS A FREQUENCY OF 0.782; ALLELE B2 (654-ILE-VAL-655) HAS A FREQUENCY OF 0.206; ALLELE B3 (654-VAL-VAL-655) HAS A FREQUENCY OF 0.012. SIMILARITY: BELONGS TO THE EGF RECEPTOR FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        RECEPTOR PROTEIN-TYROSINE KINASE ERBB-2
EXTRACELLULAR (POTENTIAL).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CYTOPLASMIC (POTENTIAL).

MISCELLANEOUS: Binding of EGF to the receptor leads to dimerization, internalization of the EGF-receptor complex, induction of the tyrosine kinase activity, stimulation of cell DNA synthesis, and cell proliferation.

SIMILARITY: BELONGS TO THE EGF RECEPTOR FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         J. Rev. Biochem. 56:881-914(1987).

FUNCTION: Receptor for EGF, but also for other members of the EGF family, as TGF-alpha, amphiregulin, betacellulin, heparin-binding EGF-like growth factor, GP30 and vaccinia virus growth factor. Is involved in the control of cell growth and differentiation. FUNCTION: Isoform 2/truncated isoform may act as an antagonist.

CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein
                                                                                                                                                                                                                                                                                                                                                     Sato C., Kim J.                                                                                                                                                                                                                                                                                                                 RECEPTORS (POTENTIAL)

-1- SUBCELLULAR LOCATION: Type I membrane protein.

-1- SUBCELLULAR LOCATION: Type I membrane protein.

-1- SUBCELLULAR LOCATION: Type I membrane protein.

-1- ALTERNATIVE FRODUCTS: 2 ISOFORMS; JM-A GROWN HERE) AND JM-B;

ARE PRODUCED BY ALTERNATIVE PROBE ESTER: JM-A IS PROCESSED BUT NOT JM-B. SO, THER RESPONSE TO PHORBOL ESTER: JM-A IS PROCESSED BUT NOT JM-B. SO, THER RESPECTOR: DEAVABLE AND NONCLEAVABLE FORMS OF THE RECEPTOR. BOTH ISOFORMS OF THE HEART.

-1- TISSUE SPECIFICITY: EXPRESSED AT HIGHEST LEVELS IN BRAIN, HEART, KIDNEY, IN ADDITION TO SKELETAL MUSCLE, PARATHYROLD, CEREBELLUM, PITUITARY, SPLEEN, TESTIS AND BREAST: LOWER LEVELS IN THYMUS, LING, SALIVARY GLAND, AND PANCREAS.

-1- FTM: LIGAND-BINDING INCREASES PHOSPHORYLATION ON TYROSINE RESIDUES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This SWISS-PROT entry is copyright. "Expression of neuregulins and their putative receptors, ErbB2 and ErbB3, is induced during Wallerian degeneration.";
J. Neurosci. 17:1642-1659(1997)
-!- FUNCTION: SPECIFICALLY BINDS AND IS ACTIVATED BY NEUREGULINS, NRG-2, NRG-3, NRG-3, HEPARIN-BINDING EGF-LIKE GROWTH FACTOR, BETACELLULIN AND NTAK. INTERACTION WITH THESE FACTORS INDUCES CELL DIFFERENCIATION.
NOT ACTIVATED BY EGF, GFF-A, AND AMPHREGULIN (BY SIMILARITY).
-!- CATALITIC ACTIVITY: ATP + a protein tyrosine = ADP + protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           tyrosine phosphate.

-1- SUBUNIT: HOMODIMER OR HETERODIMER WITH EACH OF THE OTHER ERBE RECEPTORS (POTENTIAL).

-1- SUBCELLULAR LOCATION: Type I membrane protein.

-1- TISSUB SPECIFICITY: PREFERENTIALLY EXPRESSED IN THE DEVELOPING NERVOUS SYSTEM. EXHIBITS DISTINCT AND HIGHLY REGIONALIZED PATTERNS OF EXPRESSION IN THE ADULT BRAIN, WHERE IT IS MAINLY FOUND IN THE RETICULAR NUCLEUS OF THE THALLAMUS. VERY LOW LEVELS IN KIDNEY, AND HEART.
                                                                              Craniata; Vertebrata; Euteleostomi;

-i-ALTERNATIVE PRODUCTS: TWO FORMS, A LONG TRANSMEMBRANE FORM AND A SHORT SECRETED FORM, EXIST DUE TO ALTERNATIVE SPLICING.
-i-TISSUE SPECIFICITY: EPITHELIAL TISSUES AND BRAIN.
-i-DMAIN: THE CYTOPLASMIC PART OF THE RECEPTOR MAY INTERACT WITH THE SH2 OR SH3 DOWAINS OF MANY SIGNAL-TRANSDUCING PROTEINS.
-i-PTM: LIGAND-BINDING INCREASES PHOSPHORYLATION ON TYROSINE RESIDUES AND PROMOTES ITS ASSOCIATION WITH THE PBS SUBUNIT OF PHOSPHORYLATION OF THE SECRETED SHILLARITY.
-i-DISBASE: OVEREXERESSED IN A SUBSET OF HUMAN MAWARY TUMORS.
-i-SIMILARITY: BELONGS TO THE EGF RECEPTOR FAMILY.

SUBCELLULAR LOCATION: TYPE I membrane protein.
SUBCELLULAR LOCATION: TYPE I membrane protein.
DOMAIN: THE CYTOPLASMIC PART OF THE RECEPTOR MAY INTERACT WITH THE SDA. OR SH3 DOMAINS OF MAY SIGNAL-TRANSDUCING PROTEINS.
PTM: LIGAND-BINDING INCREASES PHOSPHORYLATION ON TYROSINE RESIDUES AND PROMOTES ITS ASSOCIATION WITH THE P85 SUBUNIT OF PHOSPHATIDYLINOSITOL 3-KIRASE.
SIMILARITY: BELONGS TO THE EGF RECEPTOR FAMILY.
                                                                                                                                                                        Craniata, Vertebrata, Euteleostomi,

"Expression of neuregulins and their putative receptors, ErbB2 and ErbB3, is induced during Wallerian degeneration.";

"Neurosci. 17:1642-1659(1997).

-: FUNCTION: BINDS AND IS ACTIVATED BY NEUREGULINS AND NTAK.

-: CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein tyrosine phosphate.

-: SUBUNIT: HETERODIMER WITH EACH OF THE OTHER ERBB RECEPTORS
                                                                                                                                                                                                                                                                                                J.G.;

-!- FUNCTION: BINDS TO FOUR LIGANDS: SPITZ, GURKEN, VEIN AND ARGOS, WHICH IS WATGACONIST. TRANSDUCES THE SIGNAL THROUGH THE RAS-RAF-MAPK PATHMAY. INVOLVED IN A MYRIAD OF DEVELOPMENTAL DECISIONS.
CRITICAL FOR THE PROLIFERATION OF INAGINAL TISSUES, AND FOR THE DETERMINATION OF BOTH THE ANTERO-POSTREIOR AND DORSO-VENTRAL POLARITIES OF THE OCCYTE. IN THE EMBRYO, PLAYS A ROLE IN THE ESTABLISHMENT OF VENTRAL CELL FATES, MAINTENANCE OF PANIOSEROSA AND VENTRAL NEUROSCTODERMAL CELLS, GERM BAND RETRACTION, CELL FATES SPECIFICATION IN THE CENTRAL NERVOUS SYSTEM AND PRODUCTION OF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        TATERNATIVE PRODUCTS: 3 ISOFORMS; TYPE I (SHOWN HERE), TYPE II AND TYPE III; ARE PRODUCED BY ALTERNATIVE SPLICING.
TISSUE SPECIFICITY: UBIQUITOUSLY EXPRESSED IN EMBRYOS. IN LARVAE, UNIFORM EXPRESSION IS SEEN IN WING DISKS, GENITAL DISK, ANLAGEN OF TESTIS AND OYARY, AND BRAIN CORTEX. IN EYE-ANTENNA DISK, HIGHEST EXPRESSION IS ANTERIOR TO MORPHOGENETIC FURROW, LEVELS REMAIN HIGH IN PHOTORECEPTOR PRECURSOR CELLS. THIS PATTERN IS REVERSED IN POSTERIOR EYE DISK. IN ADULTS EXPRESSION IS HIGH IN BRAIN CORTEX SIMILARITY: BELONGS TO THE EGF RECEPTOR FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   SEQUENCE OF 1133-1137; 1155-1167 AND 1209-1216 FROM N.A., AND MUTATION
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ANALYSIS.
